A logic model is a useful guide to nurses for program planning and development. Nurses, particularly advanced practice nurses (APNs) and managers, often have program planning as a component of their role. The program planning process can take on a variety of facets, ranging from conceptualization through evaluation. Although use of a logic model is not unfamiliar to community and public health practitioners, its use by nurses has been somewhat limited. The authors chose to use a logic model to guide their planning as they created a regionally based cancer health network.

**Background**

A logic model is a systematic and visual way to present and share an understanding of the relationships among the resources necessary to operate a program, the activities needed to run a program, and the changes or outcomes to be achieved through the program. A logic model can provide a format for developing a comprehensive program, identifying a service need, or outlining a trajectory for related research.

> The addition of supportive structures, such as a timeline, process evaluation, and outcome evaluation plan, enhances the use of a logic model.

> A logic model is a useful guide to nurses for program planning and development. Nurses, particularly advanced practice nurses (APNs) and managers, often have program planning as a component of their role. The program planning process can take on a variety of facets, ranging from conceptualization through evaluation. Although use of a logic model is not unfamiliar to community and public health practitioners, its use by nurses has been somewhat limited. The authors chose to use a logic model to guide their planning as they created a regionally based cancer health network.

**Purpose/Objectives:** To describe the use of a logic model methodology in the development, implementation, and evaluation of a regionally based cancer health network.

**Data Sources:** Published articles; online references; published reports from government, state, and private organizations; and regional breast health project results.

**Data Synthesis:** Through the use of the logic model, the program objectives and outcomes were identified and actualized.

**Conclusions:** The logic model served as a framework for developing the key components of the program: infrastructure, implementation, and sustainability. Supportive structures, such as the timeline, process evaluation, and outcome evaluation plan, enhanced the use of the logic model by adding clarity to program development and program evaluation.

**Implications for Nursing:** Nurses, particularly advanced practice nurses and nurse managers, play a key role in leading program development. A logic model can be used to guide program development, implementation, and evaluation. It serves as an excellent framework for developing a program that integrates service, practice, and research.

**Key Points . . .

- A logic model is a systematic and visual way to present and share an understanding of the relationships among the resources necessary to operate a program, the activities needed to run a program, and the changes or outcomes to be achieved through the program.
- A logic model can provide a format for developing a comprehensive program, identifying a service need, or outlining a trajectory for related research.
- The addition of supportive structures, such as a timeline, process evaluation, and outcome evaluation plan, enhances the use of a logic model.
