2009–2013 Oncology Nursing Society Research Agenda: Why Is It Important?

Barbara A. Given, PhD, RN, FAAN

The 2009–2013 Oncology Nursing Society (ONS) Research Agenda is available in this issue (see page 514), spearheading the next set of priorities for ONS members to consider in their research and practice. Since 2001, ONS has released an agenda not only for its members but also for agencies concerned with cancer care, allowing researchers to expand on what ONS members find important to nursing knowledge. The 2009–2013 ONS Research Agenda provides new direction for the membership for contributing to nursing science and fostering high-quality and safe care for patients with cancer.

Advances in cancer care, resulting from discoveries in chemoprevention, genetics, molecular biology, supportive care, and changes in healthcare systems, require vital contributions from nursing research. Those contributions inform the research that can be translated into practice; some of the information derived from past agendas has already been applied in the field, helping to transform cancer care for patients and practitioners.

The vision of ONS is to lead that practice is used to consider the survey results of that survey, which is completed every four years, reviewing other funding agencies’ priorities and state of the science as the research agenda group meets to select the areas for the updated agenda and sets the newest priorities. The survey helps to identify gaps in the knowledge base for oncology nursing practice, oncology nursing research experts, clinical experts, and patient advocates, and assesses current practice and research knowledge needs, integrating this information into the agenda. Together, the data that are grounded in practice are used to consider the survey priorities and the state of current science, determining what knowledge is needed to improve quality care in oncology nursing.

Purpose

The research agenda was developed to identify key areas of science in which ONS can take a supporting role through funding and articulation to other funding agencies’ research needs for the care of patients with cancer. With broad distribution and its contribution to the vision and mission of the organization, the ONS Research Agenda can increase the knowledge base for oncology nursing practice through nursing research priority areas, identify areas to prepare future oncology nursing researchers, and provide evidence-based information to clinical nurses as critical consumers of research findings that can then be applied to practice.

Nurses must continue to understand the consequences of care, intended and unintended. We need to understand how nursing care should be altered in light of new treatment modalities.
