Sexuality in Irish Women With Gynecologic Cancer

Vicki Cleary, MSc, BSc, RGN, Josephine Hegarty, PhD, MSc, RNT, BSc, RGN, and Geraldine McCarthy, PhD, MSc, RNT, BSc, RGN

Advancements in cancer detection and treatment have led to increased survival rates among patients with cancer (Tierney, 2008), but cancer survivorship is associated with distressing long-term side effects that can negatively influence patients’ sexual health (Stilos, Doyle, & Daines, 2008). According to the National Cancer Institute (2010), sexual dysfunction is the most common side effect of cancer treatment, affecting 50% of gynecologic cancer survivors. However, Sheerin and McKenna (2000) proposed that the nursing literature is lacking in a holistic conceptualization of sexuality that has contributed to a dominant focus on the physical aspect of sexual functioning with a neglect of broader dimensions of sexuality in nursing research. Nursing research exploring the sexuality of patients with a diagnosis of cancer within an Irish context is scarce (Lavin & Hyde, 2006). In addition, traditional Irish culture and the influence of strong religious beliefs may have contributed to the consideration of sexuality as a taboo subject among Irish women (Lavin & Hyde, 2006). However, since the mid-1990s, the influence of the Catholic Church has declined, resulting in a change in attitudes toward sexuality (Higgins, Barker, & Begley, 2009; Lavin & Hyde, 2006), enabling nurses and healthcare professionals in Ireland to address sensitive issues such as sexuality more easily.

Literature Review

A review of the literature surrounding the construct of sexuality in female cancer care highlights a lack of consensus. Although numerous definitions of the term sexuality exist (Butler, Banfield, Sveinson, & Allen, 1998; Krebs, 2006; Thaler-DeMers, 2001; Tierney, 2008), few theoretical frameworks aim to provide a deeper understanding of the construct of sexuality in cancer care. However, Woods’ (1987) conceptualization of sexuality has been acknowledged by various researchers in cancer-related studies (Bruner & Boyd, 1999; Butler et al., 1998; Gamel, Hengeveld, & Davis, 2000). Woods (1987) proposed a multidimensional view of sexuality composed of three inter-related concepts: sexual self-concept, sexual relationships, and sexual functioning. Through an examination of empirical and theoretical literature surrounding sexuality in a female cancer
