Humor is a component of the human experience. It enables some patients with cancer to adapt to difficult or stressful experiences regarding their disease. So often, nurses hear patients say, “If I don’t laugh, I’ll cry.” Most of us recognize that the ability to laugh in the face of adversity is an important strategy for survival and healing. Many patients with cancer feel that laughter helps them to cope with the diagnosis, treatment, and prognosis of disease (Canfield, Henson, Aubery, & Mitchell, 1996; Johnson, 1998; Smith, 1996). Medical research has shown that humor has positive effects on the immune system and stress levels and also may have a spiritual significance for patients with cancer (Berk et al., 1989; Fry, 1992; Irwin, Daniels, Bloom, Smith, & Weiner, 1987).

Humor not only is important for patients but also helps nurses cope and care for patients. Nursing and medical programs are incorporating humor into patient care and encouraging clinicians to laugh with their patients to help them relieve stress and spiritually uplift them. Some research describes how nurses can incorporate humor in their patient care through ideas such as a “laughter room” or a humor assessment (Bellant, 1989; Erdman, 1991; Simon, 1989). Some nursing research reflects nurses’ desire to use humor and recognize the importance of humor as a coping mechanism; however, nurses often are cautious about approaching patients with humor because they fear they will appear inappropriate or unprofessional (Astedt-Kurie & Liukkonen, 1994). Tatano-Beck (1997) described five themes concerning humor and nursing:

- Humor plays a significant role in helping nurses deal effectively with difficult situations and difficult patients.
- Humor creates a sense of cohesiveness between nurses and patients and among nurses themselves.
- Humor can be used as an effective therapeutic technique between nurses and patients.
- Humor can be planned and part of the routine or can be unexpected and spontaneous.
- Sharing a humorous experience may create effects beyond the immediate moment for both nurses and patients.
